Français

1. Vue d’ensemble

Bibliothèque AFRILANG ‘std/c/compdelta‘ (niveau complex, catégorie complex). Elle expose 6 fonction(s) : deltaEncode, deltaDecode, deltaSum, secondOrder, roundTrip, maxDelta.

‘import ”std/c/compdelta”‘ · ‘use compdelta‘

```
- `deltaEncode(data list number) → list number`
- `deltaDecode(encoded list number) → list number`
- `deltaSum(data list number) → number`
- `secondOrder(data list number) → list number`
- `roundTrip(data list number) → bool`
- `maxDelta(data list number) → number`
```

2. Installation & import

Ajoutez le module à votre programme :

```
import "std/c/compdelta"
use compdelta
```

```
Niveau : complex · Catégorie : Modules complex (c/)
Domaines avancés — graphes, NLP, réseaux complexes.
```

3. Référence API

```
•
 deltaEncode(data list number) → list•
 deltaDecode(encoded list number) → list•
 deltaSum(data list number) → number•
 secondOrder(data list number) → list•
 roundTrip(data list number) → bool•
 maxDelta(data list number) → number
```

4. Exemples d’utilisation

```
import "std/c/compdelta"
use compdelta
```

```
create result = deltaEncode(/* args */)
say result
```

```
create result = deltaDecode(/* args */)
say result
```

```
create result = deltaSum(/* args */)
say result
```

```
create result = secondOrder(/* args */)
say result
```

```
create result = roundTrip(/* args */)
say result
```

```
create result = maxDelta(/* args */)
say result
```

5. Bonnes pratiques

```
•
 Préférez `import "std/c/compdelta"` en tête de fichier.•
 Lancez `afrilang check` avant de livrer.•
 Combinez avec les modules stdlib de la même catégorie.•
 Voir /stdlib/ pour le source live et les démos playground.•
 Signalez les problèmes sur GitHub si une export manque.
```

6. Annexe — source

module compdelta

```
function deltaEncode(data list number) returns list number
end
```

```
function deltaDecode(encoded list number) returns list number
end
```

```
function deltaSum(data list number) returns number
end
```

```
function secondOrder(data list number) returns list number
end
```

```
function roundTrip(data list number) returns bool
end
```

```
function maxDelta(data list number) returns number
end
end
```

English

1. Overview

AFRILANG library ‘std/c/compdelta‘ (tier complex, category complex). Exports 6 function(s): deltaEncode, deltaDecode, deltaSum, secondOrder, roundTrip, maxDelta.

‘import ”std/c/compdelta”‘ · ‘use compdelta‘

```
- `deltaEncode(data list number) → list number`
- `deltaDecode(encoded list number) → list number`
- `deltaSum(data list number) → number`
- `secondOrder(data list number) → list number`
- `roundTrip(data list number) → bool`
- `maxDelta(data list number) → number`
```

2. Installation & import

Add the module to your program:

```
import "std/c/compdelta"
use compdelta
```

```
Tier: complex · Category: Complex modules (c/)
Advanced domains — graphs, NLP, complex networks.
```

3. API reference

```
•
 deltaEncode(data list number) → list•
 deltaDecode(encoded list number) → list•
 deltaSum(data list number) → number•
 secondOrder(data list number) → list•
 roundTrip(data list number) → bool•
 maxDelta(data list number) → number
```

4. Usage examples

```
import "std/c/compdelta"
use compdelta
```

```
create result = deltaEncode(/* args */)
say result
```

```
create result = deltaDecode(/* args */)
say result
```

```
create result = deltaSum(/* args */)
say result
```

```
create result = secondOrder(/* args */)
say result
```

```
create result = roundTrip(/* args */)
say result
```

```
create result = maxDelta(/* args */)
say result
```

5. Best practices

```
•
 Prefer `import "std/c/compdelta"` at the top of your file.•
 Run `afrilang check` before shipping.•
 Combine with related stdlib modules from the same category.•
 See /stdlib/ for the live source and playground demos.•
 Report issues on GitHub if an export is missing or undocumented.
```

6. Appendix — source

module compdelta

```
function deltaEncode(data list number) returns list number
end
```

```
function deltaDecode(encoded list number) returns list number
end
```

```
function deltaSum(data list number) returns number
end
```

```
function secondOrder(data list number) returns list number
end
```

```
function roundTrip(data list number) returns bool
end
```

```
function maxDelta(data list number) returns number
end
end
```

Référence rapide / Quick reference

- Import : `import "std/c/compdelta"`
- Vérification : `afrilang check`
- Documentation : https://afrilang.dev/stdlib/std/c/compdelta/

Source (extrait)

```
module compdelta

function deltaEncode(data list number) returns list number
end

function deltaDecode(encoded list number) returns list number
end

function deltaSum(data list number) returns number
end

function secondOrder(data list number) returns list number
end

function roundTrip(data list number) returns bool
```

```
end

function maxDelta(data list number) returns number
end
end
```
