1. Vue d'ensemble

Bibliothèque AFRILANG 'std/c/csvwindow' (niveau complex, catégorie complex). Elle expose 8 fonction(s) : windSum, windMean, windMin, windMax, windVar, windStd, windNorm, filterGt.

'import "std/c/csvwindow"' · 'use csvwindow'

```
- `windSum(v list number) → number`
- `windMean(v list number) → number`
- `windMin(v list number) → number`
- `windMax(v list number) → number`
- `windVar(v list number) → number`
- `windStd(v list number) → number`
- `windNorm(v list number) → list number`
- `filterGt(col list number, threshold number) → list number`
```

2. Installation & import

Ajoutez le module à votre programme :

```
import "std/c/csvwindow"
use csvwindow
```

```
Niveau : complex · Catégorie : Modules complex (c/)
Domaines avancés — graphes, NLP, réseaux complexes.
```

3. Référence API

```
•
 windSum(v list number) → number•
 windMean(v list number) → number•
 windMin(v list number) → number•
 windMax(v list number) → number•
 windVar(v list number) → number•
 windStd(v list number) → number•
 windNorm(v list number) → list•
 filterGt(col list number, threshold number) → list
```

4. Exemples d'utilisation

```
import "std/c/csvwindow"
use csvwindow
```

```
create result = windSum(/* args */)
say result
```

```
create result = windMean(/* args */)
say result
```

```
create result = windMin(/* args */)
say result
```

```
create result = windMax(/* args */)
say result
```

```
create result = windVar(/* args */)
say result
```

```
create result = windStd(/* args */)
say result
```

5. Bonnes pratiques

```
•
 Préférez `import "std/c/csvwindow"` en tête de fichier.•
 Lancez `afrilang check` avant de livrer.•
 Combinez avec les modules stdlib de la même catégorie.•
 Voir /stdlib/ pour le source live et les démos playground.•
 Signalez les problèmes sur GitHub si une export manque.
```

6. Annexe — source

module csvwindow

```
function windSum(v list number) returns number
end
```

```
function windMean(v list number) returns number
end
```

```
function windMin(v list number) returns number
end
```

```
function windMax(v list number) returns number
end
```

```
function windVar(v list number) returns number
end
```

```
function windStd(v list number) returns number
end
```

```
function windNorm(v list number) returns list number
end
```

```
function filterGt(col list number, threshold number) returns list number
end
end
```

English

1. Overview

AFRILANG library ‘std/c/csvwindow‘ (tier complex, category complex). Exports 8 function(s): windSum, windMean, windMin, windMax, windVar, windStd, windNorm, filterGt.

‘import ”std/c/csvwindow”‘ · ‘use csvwindow‘

```
- `windSum(v list number) → number`
- `windMean(v list number) → number`
- `windMin(v list number) → number`
- `windMax(v list number) → number`
- `windVar(v list number) → number`
- `windStd(v list number) → number`
- `windNorm(v list number) → list number`
- `filterGt(col list number, threshold number) → list number`
```

2. Installation & import

Add the module to your program:

```
import "std/c/csvwindow"
use csvwindow
```

```
Tier: complex · Category: Complex modules (c/)
Advanced domains — graphs, NLP, complex networks.
```

3. API reference

```
•
 windSum(v list number) → number•
 windMean(v list number) → number•
 windMin(v list number) → number•
 windMax(v list number) → number•
 windVar(v list number) → number•
 windStd(v list number) → number•
 windNorm(v list number) → list•
 filterGt(col list number, threshold number) → list
```

4. Usage examples

```
import "std/c/csvwindow"
use csvwindow
```

```
create result = windSum(/* args */)
say result
```

```
create result = windMean(/* args */)
say result
```

```
create result = windMin(/* args */)
say result
```

```
create result = windMax(/* args */)
say result
```

```
create result = windVar(/* args */)
say result
```

```
create result = windStd(/* args */)
say result
```

5. Best practices

```
•
 Prefer `import "std/c/csvwindow"` at the top of your file.•
 Run `afrilang check` before shipping.•
 Combine with related stdlib modules from the same category.•
 See /stdlib/ for the live source and playground demos.•
 Report issues on GitHub if an export is missing or undocumented.
```

6. Appendix — source

module csvwindow

```
function windSum(v list number) returns number
end
```

```
function windMean(v list number) returns number
end
```

```
function windMin(v list number) returns number
end
```

```
function windMax(v list number) returns number
end
```

```
function windVar(v list number) returns number
end
```

```
function windStd(v list number) returns number
end
```

```
function windNorm(v list number) returns list number
end
```

```
function filterGt(col list number, threshold number) returns list number
end
end
```

Référence rapide / Quick reference

- Import : `import "std/c/csvwindow"`
- Vérification : `afrilang check`
- Documentation : https://afrilang.dev/stdlib/std/c/csvwindow/

Source (extrait)

```
module csvwindow

function windSum(v list number) returns number
end

function windMean(v list number) returns number
end

function windMin(v list number) returns number
end

function windMax(v list number) returns number
end

function windVar(v list number) returns number
end

function windStd(v list number) returns number
end

function windNorm(v list number) returns list number
end

function filterGt(col list number, threshold number) returns list number
end
end
```
