1. Vue d'ensemble

Bibliothèque AFRILANG 'std/c/statregress' (niveau complex, catégorie complex). Elle expose 8 fonction(s) : regSum, regMean, regMin, regMax, regVar, regStd, regNorm, linearRegress.

'import "std/c/statregress"' · 'use statregress'

```
- `regSum(v list number) → number`
- `regMean(v list number) → number`
- `regMin(v list number) → number`
- `regMax(v list number) → number`
- `regVar(v list number) → number`
- `regStd(v list number) → number`
- `regNorm(v list number) → list number`
- `linearRegress(x list number, y list number) → list number`
```

2. Installation & import

Ajoutez le module à votre programme :

```
import "std/c/statregress"
use statregress
```

```
Niveau : complex · Catégorie : Modules complex (c/)
Domaines avancés — graphes, NLP, réseaux complexes.
```

3. Référence API

```
•
 regSum(v list number) → number•
 regMean(v list number) → number•
 regMin(v list number) → number•
 regMax(v list number) → number•
 regVar(v list number) → number•
 regStd(v list number) → number•
 regNorm(v list number) → list•
 linearRegress(x list number, y list number) → list
```

4. Exemples d'utilisation

```
import "std/c/statregress"
use statregress
```

```
create result = regSum(/* args */)
say result
```

```
create result = regMean(/* args */)
say result
```

```
create result = regMin(/* args */)
say result
```

```
create result = regMax(/* args */)
say result
```

```
create result = regVar(/* args */)
say result
```

```
create result = regStd(/* args */)
say result
```

5. Bonnes pratiques

```
•
 Préférez `import "std/c/statregress"` en tête de fichier.•
 Lancez `afrilang check` avant de livrer.•
 Combinez avec les modules stdlib de la même catégorie.•
 Voir /stdlib/ pour le source live et les démos playground.•
 Signalez les problèmes sur GitHub si une export manque.
```

6. Annexe — source

module statregress

```
function regSum(v list number) returns number
end
```

```
function regMean(v list number) returns number
end
```

```
function regMin(v list number) returns number
end
```

```
function regMax(v list number) returns number
end
```

```
function regVar(v list number) returns number
end
```

```
function regStd(v list number) returns number
end
```

```
function regNorm(v list number) returns list number
end
```

```
function linearRegress(x list number, y list number) returns list number
end
end
```

English

1. Overview

AFRILANG library ‘std/c/statregress‘ (tier complex, category complex). Exports 8 function(s): regSum, regMean, regMin, regMax, regVar, regStd, regNorm, linearRegress.

‘import ”std/c/statregress”‘ · ‘use statregress‘

```
- `regSum(v list number) → number`
- `regMean(v list number) → number`
- `regMin(v list number) → number`
- `regMax(v list number) → number`
- `regVar(v list number) → number`
- `regStd(v list number) → number`
- `regNorm(v list number) → list number`
- `linearRegress(x list number, y list number) → list number`
```

2. Installation & import

Add the module to your program:

```
import "std/c/statregress"
use statregress
```

```
Tier: complex · Category: Complex modules (c/)
Advanced domains — graphs, NLP, complex networks.
```

3. API reference

```
•
 regSum(v list number) → number•
 regMean(v list number) → number•
 regMin(v list number) → number•
 regMax(v list number) → number•
 regVar(v list number) → number•
 regStd(v list number) → number•
 regNorm(v list number) → list•
 linearRegress(x list number, y list number) → list
```

4. Usage examples

```
import "std/c/statregress"
use statregress
```

```
create result = regSum(/* args */)
say result
```

```
create result = regMean(/* args */)
say result
```

```
create result = regMin(/* args */)
say result
```

```
create result = regMax(/* args */)
say result
```

```
create result = regVar(/* args */)
say result
```

```
create result = regStd(/* args */)
say result
```

5. Best practices

```
•
 Prefer `import "std/c/statregress"` at the top of your file.•
 Run `afrilang check` before shipping.•
 Combine with related stdlib modules from the same category.•
 See /stdlib/ for the live source and playground demos.•
 Report issues on GitHub if an export is missing or undocumented.
```

6. Appendix — source

module statregress

```
function regSum(v list number) returns number
end
```

```
function regMean(v list number) returns number
end
```

```
function regMin(v list number) returns number
end
```

```
function regMax(v list number) returns number
end
```

```
function regVar(v list number) returns number
end
```

```
function regStd(v list number) returns number
end
```

```
function regNorm(v list number) returns list number
end
```

```
function linearRegress(x list number, y list number) returns list number
end
end
```

Référence rapide / Quick reference

- Import : `import "std/c/statregress"`
- Vérification : `afrilang check`
- Documentation : `https://afrilang.dev/stdlib/std/c/statregress/`

Source (extrait)

```
module statregress

function regSum(v list number) returns number
end

function regMean(v list number) returns number
end

function regMin(v list number) returns number
end

function regMax(v list number) returns number
end

function regVar(v list number) returns number
end

function regStd(v list number) returns number
end

function regNorm(v list number) returns list number
end

function linearRegress(x list number, y list number) returns list number
end
end
```
