1. Vue d'ensemble

Bibliothèque AFRILANG 'std/c/finhedge' (niveau complex, catégorie complex). Elle expose 7 fonction(s) : hedgSum, hedgMean, hedgMin, hedgMax, hedgVar, hedgStd, hedgNorm.

'import "std/c/finhedge"' · 'use finhedge'

```
- `hedgSum(v list number) → number`
- `hedgMean(v list number) → number`
- `hedgMin(v list number) → number`
- `hedgMax(v list number) → number`
- `hedgVar(v list number) → number`
- `hedgStd(v list number) → number`
- `hedgNorm(v list number) → list number`
```

2. Installation & import

Ajoutez le module à votre programme :

```
import "std/c/finhedge"
use finhedge
```

```
Niveau : complex · Catégorie : Modules complex (c/)
Domaines avancés — graphes, NLP, réseaux complexes.
```

3. Référence API

```
•
 hedgSum(v list number) → number•
 hedgMean(v list number) → number•
 hedgMin(v list number) → number•
 hedgMax(v list number) → number•
 hedgVar(v list number) → number•
 hedgStd(v list number) → number•
 hedgNorm(v list number) → list
```

4. Exemples d'utilisation

```
import "std/c/finhedge"
use finhedge
```

```
create result = hedgSum(/* args */)
say result
```

```
create result = hedgMean(/* args */)
say result
```

```
create result = hedgMin(/* args */)
say result
```

```
create result = hedgMax(/* args */)
say result
```

```
create result = hedgVar(/* args */)
say result
```

```
create result = hedgStd(/* args */)
say result
```

5. Bonnes pratiques

```
•
 Préférez `import "std/c/finhedge"` en tête de fichier.•
 Lancez `afrilang check` avant de livrer.•
 Combinez avec les modules stdlib de la même catégorie.•
 Voir /stdlib/ pour le source live et les démos playground.•
 Signalez les problèmes sur GitHub si une export manque.
```

6. Annexe — source

module finhedge

```
function hedgSum(v list number) returns number
end
```

```
function hedgMean(v list number) returns number
end
```

```
function hedgMin(v list number) returns number
end
```

```
function hedgMax(v list number) returns number
end
```

```
function hedgVar(v list number) returns number
end
```

```
function hedgStd(v list number) returns number
end
```

```
function hedgNorm(v list number) returns list number
end
end
```

English

1. Overview

AFRILANG library ‘std/c/finhedge‘ (tier complex, category complex). Exports 7 function(s): hedgSum, hedgMean, hedgMin, hedgMax, hedgVar, hedgStd, hedgNorm.

‘import ”std/c/finhedge”‘ · ‘use finhedge‘

```
- `hedgSum(v list number) → number`
- `hedgMean(v list number) → number`
- `hedgMin(v list number) → number`
- `hedgMax(v list number) → number`
- `hedgVar(v list number) → number`
- `hedgStd(v list number) → number`
- `hedgNorm(v list number) → list number`
```

2. Installation & import

Add the module to your program:

```
import "std/c/finhedge"
use finhedge
```

```
Tier: complex · Category: Complex modules (c/)
Advanced domains — graphs, NLP, complex networks.
```

3. API reference

```
•
 hedgSum(v list number) → number•
 hedgMean(v list number) → number•
 hedgMin(v list number) → number•
 hedgMax(v list number) → number•
 hedgVar(v list number) → number•
 hedgStd(v list number) → number•
 hedgNorm(v list number) → list
```

4. Usage examples

```
import "std/c/finhedge"
use finhedge
```

```
create result = hedgSum(/* args */)
say result
```

```
create result = hedgMean(/* args */)
say result
```

```
create result = hedgMin(/* args */)
say result
```

```
create result = hedgMax(/* args */)
say result
```

```
create result = hedgVar(/* args */)
say result
```

```
create result = hedgStd(/* args */)
say result
```

5. Best practices

```
•
 Prefer `import "std/c/finhedge"` at the top of your file.•
 Run `afrilang check` before shipping.•
 Combine with related stdlib modules from the same category.•
 See /stdlib/ for the live source and playground demos.•
 Report issues on GitHub if an export is missing or undocumented.
```

6. Appendix — source

module finhedge

```
function hedgSum(v list number) returns number
end
```

```
function hedgMean(v list number) returns number
end
```

```
function hedgMin(v list number) returns number
end
```

```
function hedgMax(v list number) returns number
end
```

```
function hedgVar(v list number) returns number
end
```

```
function hedgStd(v list number) returns number
end
```

```
function hedgNorm(v list number) returns list number
end
end
```

Référence rapide / Quick reference

- Import : `import "std/c/finhedge"`
- Vérification : `afrilang check`
- Documentation : `https://afrilang.dev/stdlib/std/c/finhedge/`

Source (extrait)

```
module finhedge

function hedgSum(v list number) returns number
end

function hedgMean(v list number) returns number
end

function hedgMin(v list number) returns number
end

function hedgMax(v list number) returns number
end

function hedgVar(v list number) returns number
end

function hedgStd(v list number) returns number
end

function hedgNorm(v list number) returns list number
end
end
```
