AFRILANG

Le langage a syntaxe naturelle
qui transpile vers C++17/C++20

Manuel officiel ultra-detaille
Guide d'utilisation - Specification du langage
Bibliotheque standard - Paquets - Outils - Architecture
Playground web - Extension VS Code - WASM

Edition 1.0 - Documentation complete de l'ecosysteme AFRILANG

A propos de l'auteur

Maxime Dzidula KELI est le createur et mainteneur principal du langage AFRILANG et de son ecosysteme
(compilateur, bibliotheque standard, gestionnaire de paquets, serveur Language Server, playground web Django, extension Visual Studio Code / Cursor, et application mobile Flutter).

AFRILANG poursuit un objectif clair : offrir une syntaxe naturelle, accessible en anglais (avec alias francais), tout en produisant des executables natifs performants via une transpilation vers C++17/C++20.

Ce manuel regroupe la specification du langage, les guides d'installation et d'utilisation, la reference de la bibliotheque standard, la documentation des outils, ainsi que des exemples commentes issus du depot officiel.

Table des matieres

L'index detaille avec numeros de pages se trouve en fin d'ouvrage. Plan general :

Partie I — Vision, philosophie et architecture

Qu'est-ce qu'AFRILANG ?

AFRILANG est un langage de programmation orienté objet à syntaxe naturelle. Il est conçu pour être lisible comme de l'anglais simple, tout en compilant vers du C++17/C++20 puis en produisant un exécutable natif via g++.

Le projet vise une expérience proche des écosystèmes modernes (inspiration Nim / Crystal) : langage haut niveau, compilateur, bibliothèque standard riche, gestionnaire de paquets, serveur LSP, playground web, et cibles natives ainsi que WASM.

Pipeline de compilation

```
fichier.afr
   → Compiler (imports)
   → Lexer
   → Parser (AST)
   → Sémantique
   → CodeGen C++
   → g++ / em++
   → exécutable
```

Principes de conception

- Syntaxe naturelle : say, ask … into, if … is greater than, repeat N times
- Bilingue : anglais + alias français (dire, creer, si, alors, fin…)
- Typage clair : number, text, bool, list, map, T?, T or error
- Performance : génération C++ et exécution native
- Écosystème : pkg, LSP, playground, stdlib multi-niveaux
- Erreurs utiles : codes stables, suggestions, locales en/fr

Organisation du dépôt

include/afrilang/, src/, runtime/, stdlib/, examples/, packages/, web/ (Django), site/, vscode-afrilang/, mobile/, docs/, scripts/.

Partie II — Installation et premiers pas

Installation rapide

```
curl -fsSL https://raw.githubusercontent.com/MaximeKELI/AFRILANG/main/install.sh | bash
```

Shell

```
export PATH="$HOME/.local/bin:$PATH"
export AFRILANG_HOME="$HOME/.local/afrilang"
afrilang version
```

Build source

```
mkdir build && cd build
cmake ..
make -j$(nproc)
```

Hello

```
say "Bonjour depuis AFRILANG!"
repeat 3 times
    say "Hello"
end
```

```
afrilang run examples/hello.afr
```

Programme PAHT

```
say "=== PAHT calculator ==="
say ""

ask "Last name: " into lastName
ask "First name: " into firstName
ask "Unit price (TTC): " into unitPrice as number
ask "VAT rate (%): " into vat as number

create paht = unitPrice / (1 + vat / 100)

say ""
say "Client: " + firstName + " " + lastName
say "Unit price TTC: " + unitPrice
say "VAT: " + vat + " %"
say "PAHT (purchase price excl. tax): " + paht
```

```
afrilang run examples/paht.afr
```

Partie III — Guide d'utilisation de la CLI

`afrilang version`
→ Version + AFRILANG_HOME

`afrilang build`
→ Compile le projet

`afrilang run f.afr`
→ Compile et exécute

`afrilang check f.afr`
→ Analyse sans link

`afrilang test`
→ Suite de tests

`afrilang init nom`
→ Nouveau projet

`afrilang init nom --lib`
→ Nouvelle bibliothèque

`afrilang lsp`
→ Language Server

`afrilang fmt f.afr [-w]`
→ Formateur

`afrilang repl`
→ REPL

`afrilang pkg add/install/update/list/search/publish`
→ Paquets

`afrilang serve`
→ Playground local :8080

`afrilang debug/lint/explain/doc`
→ Outils qualité

`afrilang compile-js / build-wasm-web`
→ Cibles web

`afrilang benchmark`
→ Mesures

Projet

```
[package]
name = "mon_app"
version = "0.1.0"
main = "src/main.afr"

[dependencies]
math = "^0.1.0"
```

Partie IV — Spécification complète du langage

AFRILANG Language Specification 1.0

Comment lire cette spécification

1. Types — primitives, collections, optionnels, Result 2. POO — classes, héritage, interfaces, records 3. Contrôle — conditions, boucles, match 4. Modules & paquets — import / use (voir aussi PKG.md) 5. Async, FFI, tests — sections dédiées plus bas 6. Guide web méthodique — documentation site /docs/ (parcours numéroté)

Convention : chaque bloc se ferme par end (ou fin). Comparaisons en mots (is equal to, ...). Optionnels : T?, nothing, is defined — pas none / is some.

Types

```
| Type | Syntax | C++ |
|------|--------|-----|
| number | `number` | `double` |
| text | `text` | `std::string` |
| bool | `bool` | `bool` |
| list | `list of T` | `std::vector<T>` (classes: `vector<unique_ptr<T>>`) |
| map | `map K to V` | `std::unordered_map<K,V>` |
| optional | `T?` | `std::optional<T>` |
| result | `T or error` | `AfrResult_T` |
```

Programmation orientée objet (POO)

Classes, héritage, encapsulation et interfaces :

```
class Animal
    function speak()
        say "..."
    end
end

class Dog extends Animal
    public field name text

    function init(aName text)
        set this.name = aName
    end

    function speak()
        say name + " says Woof!"
    end
end

create rex = new Dog("Rex")
rex.speak()
```

Fonctionnalités POO :

- **Classes** — `class Nom ... end` avec méthodes `function ... end`
- **Instanciation** — `new Classe` ou `new Classe(arg1, arg2)` (constructeur `init`)
- **Champs** — `public field` / `private field` / `protected field`, accès via `this.champ` ou `obj.champ`
- **Héritage** — `class Enfant extends Parent` avec redéfinition (`override` en C++)
- **super** — `super(arg)` dans `init`, `super.methode()` pour appeler le parent
- **static** — `static field` / `static function`, appel via `Classe.methode()`
- **abstract** — `abstract class` et `abstract function` (pas d'instanciation)

- **final** — `final class` (non extensible), `final function` (non redéfinissable)
- **property** — `property text name end` (getter/setter auto)
- **destroy** — bloc `destroy ... end` → destructeur virtuel
- **Polymorphisme** — `create pet Animal = new Dog("Rex")`, listes `list of Animal`
- **Classes génériques** — `class Box<T> ... end`, `new Box<number>(42)`
- **Interfaces** — `interface I ... end` et `class C implements I, J`
- **Records** — structs légers (`record Point ... end`)

Exemples : examples/oop.afr, examples/inheritance.afr, examples/poo_demo.afr, examples/oop_full.afr, examples/polymorphic_list.afr, examples/generic_class.afr, examples/poo_advanced.afr, examples/phase11_demo.afr

Maps

```
create m = map of "a" to 1, "b" to 2
create m map text to number = map of "x" to 10
create empty = empty map text to number
say m at "a"
set m at "c" = 3
for each key, value in m do
    say key
    say value
end
```

Exceptions

```
try
    raise "something failed"
catch error e
    say e
end
```

Enums et pattern matching

```
enum Status
    case Ok
    case Error with message text
end

create e = Status.Error with "failed"

match e
    case Error with msg then
        say msg
    end
    default
        say "other"
    end
end
```

Liaison de payload : case Error with msg then lie msg au champ message.

Union taguée — alias de enum pour les types somme :

```
union Shape
    case Circle with radius number
    case Rect with width number, height number
end

create s = Shape.Circle with 5

match s
    case Circle with r then
        say r
    end
    case Rect with w, h then
        say w
    end
end
```

Exhaustivité : tous les cas doivent être couverts ou un default doit être présent.

Match en expression

Retourne une valeur (utilisable dans create, say, return, etc.) :

```
create label = match s
    case Ok then "success"
    end
    case Error with msg then msg
    end
    default "unknown"
    end
end

say match Status.Ok then "ok" end default "?" end
```

Chaque bras : case Nom then <expression> end ou default <expression> end.

Interfaces (traits)

```
interface Speakable
    function speak()
end

class Dog implements Speakable
    function speak()
        say "Woof!"
    end
end

create pet Speakable = new Dog()
create pets list of Speakable = list of new Dog()
pet.speak()
```

- Vérification des **signatures** à l'implémentation (paramètres, retour)
- Variables et listes **typées par interface**
- Polymorphisme via `std::unique_ptr<Interface>` + virtual

Surcharge d'opérateurs

Dans une classe, déclarez des opérateurs binaires :

```
class Vector
    public field x number
    public field y number

    function init(ax number, ay number)
        set this.x = ax
        set this.y = ay
    end

    operator + (other Vector) returns Vector
        return new Vector(x + other.x, y + other.y)
    end
end

create c = a + b
```

Opérateurs supportés : +, -, *, /, ==, !=, <, >.

String interpolation

```
create name = "World"
say "Hello {name}!"
```

Literal braces: {{ and }}. JSON literals ("{\"key\": 1}") are supported — a { followed by " is not treated as interpolation.

Modules

Import with import "std/io" and use io.

```
module Math
    export function add(a number, b number) returns number
        return a + b
    end

    private function helper(x number) returns number
        return x * 2
    end
end

use Math
say add(3, 4)
say Math.add(5, 6)    -- accès qualifié sans ambiguïté
```

- **`export function`** — API publique du module (documentation explicite)
- **`private function` / `private class`** — invisible via `use` (accessible dans le module)
- **`Module.fn(...)`** — appel qualifié sans `use`

Available stdlib modules: io, json, fs, http, str, log, math, time, re, collections, args, path, async, ui, game2d, game3d, plus 2151 simple (std/nom), 102 medium (std/m/nom), 5710 complex (std/c/nom) — see docs/STDLIB_*.md.

Syntaxe bilingue (français / anglais)

Les mots-clés anglais acceptent des alias français (ex. dire = say, si/alors/sinon, fin = end, creer = create, fonction = function, classe = class, utiliser = use, importer = import, tantque = while, cas/defaut/avec pour match, types nombre/texte/booleen, etc.).

Exemple : examples/language_demo.afr

Generics

```
function identity<T>(x T) returns T
    return x
end

say identity(42)              -- inférence
say identity<number>(42)      -- paramètre de type explicite
```

Default parameters

```
function greet(name text, prefix text = "Hello") returns text
    return join(list of prefix, " ", name)
end

say greet("World")
say greet("Africa", "Bonjour")
```

Numeric for loops

```
for i from 1 to 10 do
    say i
end

for n from 0 to 10 step 2 do
    say n
end
```

Constants

```
create const MAX = 100
create const NAME text = "AFRILANG"
```

Lambdas (fonctions anonymes)

```
create doubleIt = function(x number) returns number
    return x * 2
end

say doubleIt(21)

function apply(fn function number to number, value number) returns number
    return fn(value)
end

say apply(doubleIt, 10)
```

Type fonction : function number to number, function number, text to text, etc.

map / filter / reduce (listes + lambdas)

Syntaxe naturelle (sans import) :

```
create doubled = map each x in nums do
    return x * 2
end

create big = filter each x in nums where x is greater than 3

create total = reduce nums from 0 with each acc, x do
    return acc + x
end

create flat = flatMap each n in nums do
    return list of n, n * 10
end
```

reduce fonctionne aussi sur list text (valeur initiale text).

Syntaxe explicite via std/collections :

```
import "std/collections"
use collections

create doubled = mapNumbers(nums, function(x number) returns number
    return x * 2
end)

create big = filterNumbers(nums, function(x number) returns bool
    if x is greater than 3 then
        return yes
    else
        return no
    end
end)

create total = reduceNumbers(nums, function(acc number, x number) returns number
    return acc + x
end, 0)
```

Async / await

Les fonctions async retournent implicitement un task T (coroutines C++20). Support complet : returns T or error, await dans les tests, I/O async.

```
import "std/async"
use async

async function wait(ms number) returns text or error
    if ms is less than 0 then
        return error "invalid delay"
    end
    await sleep(ms)
    return "ready"
end

async function main()
    create r = await wait(10)
    if r is error then
        say r.message
    else
        say r.value
    end
end

test "async in test block"
    create r = await wait(1)
    assert r.value is equal to "ready"
end

await main()
```

```
| Fonctionnalité | Détail |
|----------------|--------|
| `async function` | Retourne `task T` ou `task (T or error)` |
| `await` | Global, fonctions async, blocs `test` |
| `std/async` | `sleep(ms)` — scheduler avec file de timers |
| `std/http` | `httpGetAsync`, `httpPostAsync` — thread pool |
| `std/io` | `readFileAsync` — lecture fichier non bloquante |
| Compilation | C++20 coroutines (`-std=c++20 -fcoroutines -pthread`) |
```

Interfaces graphiques

Syntaxe naturelle pour créer des fenêtres SDL2 (backend runtime/ui.hpp).

```
open window titled "Demo" with width 640, height 480

while window is open do
    clear background color 28, 28, 36
    draw text "Bonjour!" at 80, 80 size 32
    if button "Quitter" at 220, 350 width 200 height 50 is clicked then
        close window
    end
    show frame
end
```

```
| Instruction / expression | Description |
|--------------------------|-------------|
| `open window titled ... with width ..., height ...` | Ouvre une fenêtre |
| `while window is open do` | Boucle principale (appelle `beginFrame` automatiquement) |
| `clear background color r, g, b` | Efface l'écran (RGB 0–255) |
| `draw text "..." at x, y size n` | Affiche du texte |
| `button "..." at x, y width w height h is clicked` | Bouton cliquable (booléen) |
| `show frame` | Présente l'image à l'écran |
| `close window` | Ferme la fenêtre |
```

Jeux 2D (module `std/ui`)

Primitives pour créer de vrais jeux (rectangles colorés, timing, clavier) :

```
| Fonction | Description |
|----------|-------------|
| `fillRect(x, y, w, h, r, g, b)` | Rectangle plein (RGB 0–255) |
| `drawRect(x, y, w, h, r, g, b)` | Contour de rectangle |
| `drawTextColor(text, x, y, size, r, g, b)` | Texte coloré |
| `deltaMs()` | Millisecondes depuis la dernière frame |
| `windowWidth()` / `windowHeight()` | Taille de la fenêtre |
| `isKeyDown(key)` / `wasKeyPressed(key)` | Clavier (WASD, flèches, Space, Escape) |
| `mouseX()` / `mouseY()` | Souris (position) |
| `isMouseDown()` / `wasMousePressed()` / `wasMouseClicked()` | Souris (bouton gauche) |
| `fps()` | Images par seconde (moyenne glissante) |
```

Moteur 2D (`std/game2d`)

Bibliothèque de jeu haut niveau (grille, timers, entrées, collisions) — bâtie sur std/ui :

```
| Fonction | Description |
|----------|-------------|
| `configureGrid(cols, rows, cellSize, padX, padY)` | Configure une grille logique |
| `gridWindowWidth()` / `gridWindowHeight()` | Taille fenêtre pour la grille |
| `fillCell(col, row, r, g, b)` | Dessine une case |
| `fillBoard` / `drawWalls` / `drawGridLines` | Arrière-plan et murs |
| `fillCircleSolid(x, y, radius, r, g, b)` | Cercle plein (nourriture, effets) |
| `everyMs(name, delta, interval)` | Timer nommé (retourne `yes` quand l’intervalle est écoulé) |
| `updateDirection(curDx, curDy)` + `inputDirX()` / `inputDirY()` | Entrées clavier sans demi-tour |
| `gridHas(xs, ys, count, gx, gy)` | Collision sur grille |
| `pulse01(period)` | Animation sinusoïdale 0–1 |
| `drawCenteredText` / `drawHud` | Interface de jeu |
| `moveIntervalForScore(score, base, min)` | Vitesse progressive |
```

Sprites PNG : loadSprite(name, path), drawSprite, drawSpriteScaled, drawSpriteCell, hasSprite

Spritesheet : loadSpriteSheet(name, path, frameW, frameH), drawSpriteFrame, drawSpriteFrameCell, sheetCols, sheetRows

Sons : loadSound(name, path), playSound, playSoundVolume(name, 0-128)

Musique : loadMusic(name, path), playMusic(name, loops), stopMusic(), setMusicVolume(0-128)

Caméra : setCamera, followCamera(x, y, smooth), configureViewport(cols, rows) pour cartes plus grandes que l’écran

Triggers : defineTrigger(name, x, y, w, h), pointInTrigger(name, wx, wy), mouseInTrigger(name)

Sauvegarde : saveValue(path, key, value), loadValue(path, key, default), loadHighScore(path), saveHighScore(path)

Debug : drawFps(x, y) affiche le FPS à l’écran

import "std/game2d" puis use game2d. Voir aussi std/game (score, niveau, XP) et std/gamestate (états menu/jeu/pause).

États de jeu (`std/gamestate`)

Machine à états simple pour menus, pause et game over :

```
| Fonction | Description |
|----------|-------------|
| `setState(name)` | Change l’état courant |
| `getState()` / `isState(name)` | Lecture de l’état |
| `stateTimeMs()` | Temps passé dans l’état courant |
| `wasStateChanged()` | `yes` une frame après un changement |
| `tickState(deltaMs)` | À appeler chaque frame dans la boucle |
```

Moteur 3D (`std/game3d`)

Jeux 3D avec OpenGL (SDL2 + GL) :

```
| Fonction | Description |
|----------|-------------|
| `openWindow` / `isOpen` / `beginFrame` / `showFrame` | Boucle 3D |
| `clearScreen(r, g, b)` | Efface l’écran et le tampon de profondeur |
| `setCamera(x, y, z, yaw, pitch)` + `applyCamera()` | Caméra perspective |
| `updateFlyCamera(moveSpeed, turnSpeed)` | Vol libre WASD + QE + flèches |
| `drawCube`, `drawSphere`, `drawPlane`, `drawGrid`, `drawAxis` | Primitives 3D |
| `setSceneRotation` / `applySceneRotation` | Rotation du monde |
| `pickBody(screenX, screenY)` | Picking simple (raycast) → index du corps touché, ou -1 |
| `pickBodyName(screenX, screenY)` | Nom du corps touché, ou texte vide |
| `mouseX()` / `mouseY()` / `isMouseDown()` | Souris en 3D |
| `drawSkyGradient(topR,G,B, botR,G,B)` | Ciel dégradé plein écran |
```

```
./build/afrilang examples/game3d_demo.afr -o game3d_demo --run
```

Contrôles : WASD déplacer, QE monter/descendre, flèches regarder, Échap quitter.

Textures 3D : loadTexture3d, drawPlaneTextured, drawCubeTextured

Modèles OBJ : loadModel, drawModel, drawModelColored

Physique simple : createBody, setBodyVelocity, stepPhysics(delta, gravity), bodyX/Y/Z, applyImpulse

```
./build/afrilang examples/game3d_physics.afr -o game3d_physics --run
```

Espace = lancer une bille supplémentaire.

3D avancé (éclairage, brouillard, particules)

```
| Fonction | Description |
|----------|-------------|
| `enableLighting`, `setAmbientLight`, `setSunLight`, `applyLighting` | Éclairage directionnel |
| `setFog`, `applyFog` | Brouillard atmosphérique |
| `drawModelLit` | Modèle OBJ avec normales et lumière |
| `createBoxBody`, `drawBox`, `drawBody` | Physique et rendu de boîtes |
| `stepPhysicsEx` | Gravité + vent + frottement |
| `setWind`, `setBodyFriction`, `setBodyRestitution` | Paramètres physiques |
| `emitBurst`, `updateParticles`, `drawParticles` | Système de particules |
| `followBody` | Caméra qui suit un corps |
```

```
./build/afrilang examples/game3d_complex.afr -o game3d_complex --run
```

C bascule caméra libre / suivi du héros.

3D expert (skybox, GLSL, glTF, physique box-box)

```
| Fonction | Description |
|----------|-------------|
| `loadSkyboxFace(face, path)` | Face du ciel : `px`, `nx`, `py`, `ny`, `pz`, `nz` |
| `hasSkybox()` / `drawSkybox(halfSize)` | Cube ciel texturé centré sur la caméra |
| `loadShader(name, vert, frag)` | Programme GLSL 1.20 |
| `useShader` / `stopShader` | Active / désactive le shader |
| `setShaderFloat` / `setShaderVec3` | Uniformes shader |
| `drawModelShader(shader, model, x,y,z, scale, rotY)` | Modèle OBJ avec shader |
| `loadGltf(name, path)` | Chargeur glTF 2.0 minimal (`.gltf` + buffer embarqué ou `.bin`) |
| `drawGltf` / `drawGltfLit` | Rendu modèle glTF |
| `stepPhysicsEx` | Collisions sphère-sphère, box-box et sphère-box |
```

```
./build/afrilang examples/game3d_advanced.afr -o game3d_advanced --run
```

Clic souris : pickBodyName sur les corps physiques.

glTF binaire, animations, éditeur, réseau

```
| Fonction | Description |
|----------|-------------|
| `loadGlb(name, path)` | Alias `.glb` (binaire) |
| `gltfAnimCount`, `playGltfAnim`, `updateGltfAnims`, `gltfAnimRotY` | Animations de rotation glTF |
| `setEditMode`, `addLevelGltf`, `addLevelModel`, `drawLevel` | Éditeur de niveau intégré |
| `saveLevel(path)`, `loadLevel(path)` | Format texte `type asset x y z scale rotY` |
| `pickGround(screenX, screenY)` + `pickGroundX/Z` | Clic sur le sol (y=0) |
```

Module std/gamenet (UDP) : hostGame(port), joinGame(host, port), sendPose, pollNet, remoteX/Y/Z/RotY

```
./build/afrilang examples/game3d_editor.afr -o editor --run   # E éditer, clic placer, S/L sauver/charger
./build/afrilang examples/game3d_net.afr -o net --run         # 2 instances : host + join
```

Exemple minimal :

```
import "std/ui"
use ui

openWindow("Jeu", 640, 480)
while isOpen() do
    beginFrame()
    clearBackground(18, 18, 24)
    fillRect(100, 100, 48, 48, 90, 200, 120)
    drawTextColor("Score: 0", 20, 20, 24, 240, 240, 245)
    showFrame()
end
```

Module stdlib équivalent : import "std/ui" puis use ui (openWindow, drawButton, etc.).

Compilation : -lSDL2 -lSDL2_ttf (SDL2 + SDL2_ttf requis).

Modules

Import with import "std/io" and use io.

Available stdlib modules: io, json, fs, http, str, log, math, time, re, collections, args, path, async, ui, game2d, game3d, plus 2151 simple (std/nom), 102 medium (std/m/nom), 5710 complex (std/c/nom) — see docs/STDLIB_*.md.

std/args

```
import "std/args"
use args

say count()
say at(0)
```

std/path

```
import "std/path"
use path

say join("home", "user")
say basename("/tmp/file.txt")
```

REPL

```
afrilang repl
```

Commandes : :help, :reset, :show, :run, :load fichier.afr, :type expr, :history, :paste / :end, :quit

Foreign Function Interface (FFI)

```
extern from "m" function sin(x number) returns number
```

Bibliothèques autorisées : m, pthread, dl, curl, c.

Types FFI : number → double, text → const char*, bool, pointer.

Identifiants et encodage

- Fichiers source : **UTF-8** obligatoire
- Identifiants : ASCII `[A-Za-z_][A-Za-z0-9_]*` ou **Unicode** (lettres UTF-8)
- Mots réservés : voir section « Syntaxe bilingue »

Gestion de paquets

```
[dependencies]
math = "0.1.0"
```

Commandes : afrilang pkg add math, pkg install, pkg list, pkg publish.

Le lockfile afrilang.lock fige les versions installées. Semver 2.0 appliqué à l'installation.

Grammaire (EBNF, extrait)

```
program     = { declaration | statement } ;
declaration = class_decl | function_decl | enum_decl | module_decl | extern_decl ;
statement   = "say" expression
              | "create" identifier [ type ] "=" expression
              | "if" expression "then" block [ "else" block ] "end"
              | "match" expression match_arm { match_arm } "end" ;
expression  = literal | identifier | call | binary_op | "match" expression ... ;
```

Politique de compatibilité

- **1.x** : compatibilité source ascendante pour les programmes valides 1.0
- Numéros d'erreur stables (`E3002`, etc.)
- Variable d'environnement `AFRILANG_LOCALE=en|fr` pour les messages

Complément README — syntaxe

Syntaxe du langage

Affichage

```
say "Bonjour le monde"
```

Variables

```
create x = 42
create name = "Alice"
create x number = 42
create flag bool = true
set x = 100
```

Booléens

```
create active bool = true
create ok = yes
create failed = no

if active is equal to true then
    say "Actif"
else
    say "Inactif"
end
```

Types booléens : true, false, yes, no, type bool.

Listes

```
create nums = list of 1, 2, 3
create bracket = [10, 20, 30]
create empty = empty list number

say nums at 0
say bracket[2]
say length of nums

set nums at 1 = 99
add 4 to nums
```

```
for each item in nums do
    say item
end
```

Entrée utilisateur

```
ask "What is your name?" into name
say name

ask "Age:" into age as number
say "Next year you will be " + (age + 1)

ask "Price:" into price as number
ask "VAT (%):" into vat as number
create ht = price / (1 + vat / 100)
say "Excl. tax: " + ht
```

ask déclare automatiquement la variable. Sans as, le type est text. Avec as number, la saisie est convertie en nombre.

Classes et méthodes

```
class Person
    function speak()
        say "Bonjour"
    end
end

create person = new Person
person.speak()
```

Champs et constructeurs

```
class Person
    public field name text
    private field age number

    function init(aName text, aAge number)
        set this.name = aName
        set this.age = aAge
    end

    function greet()
        say name
    end
end

create bob = new Person
set bob.name = "Bob"
```

Records (structs)

```
record Point
    field x number
    field y number
end
```

Modules

```
module Math
    function add(a number, b number) returns number
        return a + b
    end
end

use Math
say add(3, 4)
```

Imports multi-fichiers

```
import "helpers.afr"
```

Les fichiers importés apportent leurs déclarations (fonctions, classes, records, modules).

Héritage

```
class Animal
    function speak()
        say "..."
    end
end

class Dog extends Animal
    function speak()
        say "Woof!"
    end
end
```

Fonctions avec paramètres et retour

```
function add(a number, b number) returns number
    return a + b
end
```

Types disponibles : number, text, bool, list number, list text, ou nom de classe/record.

Conditions

```
if age is greater than 18 then
    say "Adulte"
else
    say "Mineur"
end

if score is equal to 100 then
    say "Parfait"
end

if x is not equal to 0 then
    say "Non nul"
end
```

Boucles

```
repeat 5 times
    say "Hello"
end

while count is less than 10 do
    say count
    set count = count + 1
end

for each item in nums do
    say item
end
```

Contrôle de boucle

```
while true do
    if done is equal to true then
        stop
    end
    if skipNext is equal to true then
        skip
    end
end
```

- `stop` → `break`
- `skip` → `continue`

Opérateurs mathématiques

```
create result = 10 + 5 * 2
say x - y
say a / b
```

Result / gestion d'erreurs

Les fonctions peuvent retourner une valeur ou une erreur :

```
function divide(a number, b number) returns number or error
    if b is equal to 0 then
        return error "Division par zero"
    end
    return a / b
end

create ok = divide(10, 2)
if ok is error then
    say ok.message
else
    say ok.value
end
```

- `returns T or error` — type de retour Result
- `return error "message"` — retourne une erreur
- `if x is error then` — teste si le Result est une erreur
- `.value` et `.message` — accès aux champs du Result

Interfaces (traits)

```
interface Speakable
    function speak()
end

interface Named
    function getName() returns text
end

class Dog extends Animal implements Speakable, Named
    function speak()
        say "Woof!"
    end

    function getName() returns text
        return "Rex"
    end
end
```

Les interfaces définissent des signatures de méthodes ; les classes qui les implémentent doivent fournir les méthodes correspondantes.

Tests et assertions

```
function add(a number, b number) returns number
    return a + b
end

test "addition works"
    create r = add(2, 3)
    assert r is equal to 5
end
```

Les blocs test sont compilés et exécutés automatiquement au lancement du programme. assert vérifie une condition et incrémente un compteur d'échecs en cas d'erreur.

Extension VS Code / Cursor

L'extension dans vscode-afrilang/ fournit :

- **LSP complet** — diagnostics en temps réel, complétion des mots-clés, formatage (`Shift+Alt+F`)
- **Coloration** — syntaxe anglaise + enums, match, null-safety
- **Commandes** — exécuter / vérifier un fichier `.afr` depuis l'éditeur
- **Icône** — carte d'Afrique dans Extensions et à côté des fichiers `.afr`

Installation :

```
cd build && cmake .. && make          # compiler afrilang
cd ../vscode-afrilang
npm install
code --install-extension .              # Cursor: cursor --install-extension .
```

Configuration (settings.json) :

```
{
  "afrilang.serverPath": "/chemin/vers/AFRILANG/build/afrilang",
  "editor.formatOnSave": true,
  "[afrilang]": { "editor.tabSize": 4 }
}
```

Voir vscode-afrilang/README.md pour le détail.

Formateur (`afrilang fmt`)

Normalise l'indentation (4 espaces) et la syntaxe naturelle :

```
afrilang fmt examples/hello.afr       # affiche sur stdout
afrilang fmt examples/hello.afr -w    # réécrit le fichier
```

REPL interactif

```
afrilang repl
>>> create x = 42
>>> say x + 8
50
>>> :help
>>> :quit
```

Commandes : :help, :reset, :show, :paste / :end, :quit.

Symboles de debug

Le code C++ généré inclut des directives #line pointant vers le fichier .afr source, et g++ est invoqué avec -g. Vous pouvez débugger avec GDB en suivant les numéros de ligne AFRILANG :

```
afrilang run examples/hello.afr --emit
gdb ./hello
```

FFI (Foreign Function Interface)

Appeler des fonctions C/C++ depuis AFRILANG :

```
extern from "m" function sin(x number) returns number
extern from "m" function sqrt(x number) returns number

say sin(3.14159 / 2)
say sqrt(16)
```

Bibliothèques supportées : m/libm → -lm, pthread → -lpthread, etc.

Types FFI : number, text (→ const char), pointer (→ void).

Gestionnaire de paquets (`afrilang pkg`)

```
afrilang pkg list              # paquets disponibles dans packages/
afrilang pkg search math       # recherche par nom ou description
afrilang pkg add math          # copie dans vendor/ + afrilang.toml
afrilang pkg install           # installe toutes les dépendances
afrilang pkg publish ./my_pkg  # publie dans packages/ (registre local)
```

Registre local : packages/index.json (généré à la publication).

Dans afrilang.toml :

```
[dependencies]
math = "0.1.0"
```

Import dans le code :

```
import "pkg/math/math.afr"
use Math
say square(5)
```

Cross-compilation

```
afrilang build --target linux-arm64
afrilang run examples/hello.afr --target wasm32
```

Cibles : native (défaut), linux-x64, linux-arm64, wasm32 (nécessite le toolchain correspondant).

Playground web

```
afrilang serve        # http://localhost:8080
afrilang serve 3000   # port personnalisé
```

Le site dans site/ propose un éditeur en ligne avec :

- exemples préchargés (Hello, OOP, enums/match, generics)
- exécution via `/api/run`
- formatage via `/api/fmt`
- raccourci **Ctrl+Enter** pour exécuter

Syntaxe anglaise

AFRILANG utilise une syntaxe en anglais à la manière du langage naturel :

```
if age is greater than 18 then
    say "Adult"
else
    say "Minor"
end

repeat 3 times
    say "Hello"
end
```

Mode éducatif

Dans le code — prefixe explain :

```
explain say "Hello"
explain create x = 10
```

Affiche une explication pédagogique puis exécute l'instruction.

En CLI :

```
afrilang explain examples/educational.afr
afrilang explain examples/hello.afr --line 1
```

Enums, pattern matching et null-safety

Enums — sommes algébriques avec champs optionnels par cas :

```
enum Status
    case Ok
    case Error with message text
end

create s = Status.Ok
create e = Status.Error with "failed"
```

Pattern matching — match sur une valeur enum :

```
match s
    case Ok then
        say "ok"
    end
    default
        say "other"
    end
end
```

Null-safety — types optionnels (text?) et nothing :

```
create nickname text? = nothing
if nickname is defined then
    say nickname
end
```

Generics

Type parameters on functions with inference at call sites:

```
function identity<T>(x T) returns T
    return x
end

function first<T>(items list of T) returns T
    return items at 0
end

say identity(42)
say identity("hello")

create nums = list of 10, 20, 30
say first(nums)

create words = list of "a", "b", "c"
say first(words)
```

Generics transpile to C++ template<typename T> functions. Types are inferred from arguments (42 → number, "hello" → text, list element types from list of ...).

Partie V — Entrée utilisateur (ask)

```
ask "Name:" into name
ask "Age:" into age as number
say "Hi " + name + " " + age
```

- Auto-déclaration de variable
- as number / as text
- say et + convertissent les nombres
- Mode console interactive (sans timeout sandbox)

Exemple PAHT

```
say "=== PAHT calculator ==="
say ""

ask "Last name: " into lastName
ask "First name: " into firstName
ask "Unit price (TTC): " into unitPrice as number
ask "VAT rate (%): " into vat as number

create paht = unitPrice / (1 + vat / 100)

say ""
say "Client: " + firstName + " " + lastName
say "Unit price TTC: " + unitPrice
say "VAT: " + vat + " %"
say "PAHT (purchase price excl. tax): " + paht
```

Partie VI — POO, modules, async, FFI, tests

```
import "std/json"
use json
```

```
extern from "m" function cos(x number) returns number
```

```
test "addition"
    assert 1 + 1 is equal to 2
end
```

GUI/jeux : std/ui, std/game2d, std/game3d, examples/snake.afr, gui_demo.afr.

Partie VII — Guides pédagogiques

Leçon 1 — Afficher

say écrit sur stdout.

```
say "Hello"
```

Leçon 2 — Variables

create et set.

```
create x = 1
set x = 2
```

Leçon 3 — Conditions

Comparaisons naturelles.

```
if x is greater than 0 then
    say "ok"
end
```

Leçon 4 — Boucles

repeat / while / for each.

```
repeat 3 times
    say "x"
end
```

Leçon 5 — Listes

list → vector.

```
create n = list of 1, 2
add 3 to n
```

Leçon 6 — Fonctions

Réutilisation.

```
function add(a number, b number) returns number
    return a + b
end
```

Leçon 7 — ask

Saisie typée.

```
ask "n:" into n as number
```

Leçon 8 — Classes

POO.

```
class A
    function hi()
        say "hi"
    end
end
```

Leçon 9 — std

Core stdlib.

```
import "std/math"
use math
say sqrt(9)
```

Leçon 10 — Projet

Cycle de vie.

```
afrilang init app
afrilang run src/main.afr
```

Intermédiaire / avancé

```
function id<T>(v T) returns T
    return v
end
```

```
afrilang run app.afr --target wasm32
```

Partie VIII — Bibliothèque standard

- Core stabilisé (runtime C++)
- Simple ~2150 modules (std/nom)
- Medium ~100 modules (std/m/nom)
- Complex ~5700 modules (std/c/nom)
- ~7971 modules documentés

Core

Core stdlib AFRILANG

La masse de fichiers sous stdlib/ (catalogues générés) sert surtout à la complétion / signatures IDE. Seuls les modules ci-dessous sont considérés « core » : backend C++ réel dans runtime/, compatibilité 1.x, documentation prioritaire.

Voir aussi STDLIB_API.md (API prioritaire Vague 3), STDLIB_GEN.md, et isLegacyStdlibModule dans src/utils/stdlib_registry.cpp. Suite de tests : afrilang test --specs.

Modules core (stabilisés)

```
| Module | Import typique | Domaine |
|--------|----------------|---------|
| io | `std/io` | Entrées / sorties |
| json | `std/json` | JSON |
| fs | `std/fs` | Fichiers |
| http | `std/http` | HTTP sync |
| str | `std/str` | Chaînes |
| log / logging | `std/log` | Journalisation |
| math | `std/math` | Math |
| time / chrono | `std/time` | Temps |
| re | `std/re` | Regex |
| collections | `std/collections` | Structures |
| args | `std/args` | CLI args |
| path | `std/path` | Chemins |
| async | `std/async` | Coroutines |
| ui | `std/ui` | Fenêtres (natif) |
| game2d / game3d | `std/game2d` | Jeux |
| env | `std/env` | Environnement |
| random | `std/random` | Aléatoire |
| crypto | `std/crypto` | Crypto de base |
| csv / yaml / html | `std/csv` … | Formats |
| uuid / base64 / hex / url | … | Utilitaires |
```

Hors core (expérimental / généré)

- `stdlib/*.afr`, `stdlib/m/`, `stdlib/c/` — stubs de signatures, **pas** une garantie de profondeur API
- Packs « ultra » (GIS, data, …) — utiles en démo ; stabilité au cas par cas

Politique

1. Bugs et docs prioritaires sur le core. 2. Un module généré n’entre dans le core qu’avec runtime réel + tests + entrée ici. 3. Les catalogues générés peuvent évoluer sans promesse semver stricte.

API core

Core stdlib API (Vague 3)

Documentation prioritaire des backends réels (runtime/*.hpp). Les catalogues générés (stdlib/m/, stdlib/c/, stubs massifs) restent expérimentaux.

Voir aussi CORE_STDLIB.md et afrilang test --specs.

`std/str`

```
| Fonction | Rôle |
|----------|------|
| `trim(text)` | Enlève espaces / tabs / newlines |
| `contains(text, needle)` | Sous-chaîne |
| `replace(text, from, to)` | Remplacement global |
| `split(text, sep)` | Découpe en liste |
| `join(parts, sep)` | Jointure |
| `toString(...)` | Conversion |
```

Tests : tests/stdlib/str.afr

`std/math`

```
| Fonction | Rôle |
|----------|------|
| `abs(n)` | Valeur absolue |
| `floor(n)` / `ceil(n)` | Entiers autour |
| `pow(base, exp)` | Puissance |
| `random()` | `[0, 1)` |
```

Tests : tests/stdlib/math.afr

`std/json`

```
| Fonction | Rôle |
|----------|------|
| `makeObject(key, value)` | Objet simple |
| `parse(text)` / `stringify(doc)` | Sérialisation |
| `getString` / `getNumber` | Lecture |
```

Tests : tests/stdlib/json.afr

WASM

Compatibles wasm32 (voir WASM_COMPAT.md) : str, math, json, collections, path, log, async (subset). Natif seulement : fs/io fichiers, http, ui, game*.

Démo : examples/tier8_stdlib.afr

SIMPLE — référence complète

Bibliothèques simples AFRILANG

2151 modules importables via import "std/nom" puis use nom.

std/absnum

import "std/absnum" · use absnum

- `absNumber(n number) → number`
- `absDiff(a number, b number) → number`

std/sqrtlib

import "std/sqrtlib" · use sqrtlib

- `sqrtNumber(n number) → number`
- `square(n number) → number`

std/cbrtlib

import "std/cbrtlib" · use cbrtlib

- `cbrtNumber(n number) → number`
- `cube(n number) → number`

std/min2

import "std/min2" · use min2

- `min2(a number, b number) → number`
- `min3(a number, b number, c number) → number`

std/max2

import "std/max2" · use max2

- `max2(a number, b number) → number`
- `max3(a number, b number, c number) → number`

std/clamp

import "std/clamp" · use clamp

- `clamp(n number, lo number, hi number) → number`
- `clamp01(n number) → number`

std/lerp

import "std/lerp" · use lerp

- `lerp(a number, b number, t number) → number`
- `inverseLerp(a number, b number, v number) → number`

std/sign

import "std/sign" · use sign

- `sign(n number) → number`
- `isPositive(n number) → bool`

std/parity

import "std/parity" · use parity

- `isEven(n number) → bool`
- `isOdd(n number) → bool`

std/trig

import "std/trig" · use trig

- `sinDeg(deg number) → number`
- `cosDeg(deg number) → number`

std/trig2

import "std/trig2" · use trig2

- `tanDeg(deg number) → number`
- `cotDeg(deg number) → number`

std/arc

import "std/arc" · use arc

- `asinSafe(n number) → number`
- `acosSafe(n number) → number`

std/hyper

import "std/hyper" · use hyper

- `sinhN(n number) → number`
- `coshN(n number) → number`

std/deg

import "std/deg" · use deg

- `degToRad(d number) → number`
- `radToDeg(r number) → number`

std/roundlib

import "std/roundlib" · use roundlib

- `roundN(n number) → number`
- `truncN(n number) → number`

std/modlib

import "std/modlib" · use modlib

- `mod(a number, b number) → number`
- `wrap(n number, lo number, hi number) → number`

std/gcdlib

import "std/gcdlib" · use gcdlib

- `gcd(a number, b number) → number`
- `lcm(a number, b number) → number`

std/fact

import "std/fact" · use fact

- `factorial(n number) → number`
- `doubleFact(n number) → number`

std/fib

import "std/fib" · use fib

- `fib(n number) → number`
- `fibB(n number) → number`

std/prime

import "std/prime" · use prime

- `isPrime(n number) → bool`
- `nextPrime(n number) → number`

std/mean

import "std/mean" · use mean

- `mean2(a number, b number) → number`
- `mean3(a number, b number, c number) → number`

std/percent

import "std/percent" · use percent

- `percent(part number, whole number) → number`
- `percentChange(oldVal number, newVal number) → number`

std/ratio

import "std/ratio" · use ratio

- `ratio(a number, b number) → number`
- `proportion(a number, b number, total number) → number`

std/dice

import "std/dice" · use dice

- `roll(sides number) → number`
- `roll2d6(ignored number) → number`

std/coin

import "std/coin" · use coin

- `flip(ignored number) → bool`
- `flipN(n number) → number`

std/upper

import "std/upper" · use upper

- `toUpper(s text) → text`
- `toLower(s text) → text`

std/capitalize

import "std/capitalize" · use capitalize

- `capitalize(s text) → text`
- `titleWord(s text) → text`

std/prefix

import "std/prefix" · use prefix

- `startsWith(s text, prefix text) → bool`
- `endsWith(s text, suffix text) → bool`

std/repeat

import "std/repeat" · use repeat

- `repeatText(s text, n number) → text`
- `repeatChar(c text, n number) → text`

std/pad

import "std/pad" · use pad

- `padLeft(s text, n number, ch text) → text`
- `padRight(s text, n number, ch text) → text`

std/reverse

import "std/reverse" · use reverse

- `reverseText(s text) → text`
- `reverseWords(s text) → text`

std/textlen

import "std/textlen" · use textlen

- `length(s text) → number`
- `isEmpty(s text) → bool`

std/concat

import "std/concat" · use concat

- `concat2(a text, b text) → text`
- `concat3(a text, b text, c text) → text`

std/compare

import "std/compare" · use compare

- `equals(a text, b text) → bool`
- `equalsIgnoreCase(a text, b text) → bool`

std/celsius

import "std/celsius" · use celsius

- `cToF(c number) → number`
- `fToC(f number) → number`

std/kelvin

import "std/kelvin" · use kelvin

- `cToK(c number) → number`
- `kToC(k number) → number`

std/distance

import "std/distance" · use distance

- `kmToMiles(km number) → number`
- `milesToKm(mi number) → number`

std/weight

import "std/weight" · use weight

- `kgToLb(kg number) → number`
- `lbToKg(lb number) → number`

std/bytes

import "std/bytes" · use bytes

- `bytesToKb(b number) → number`
- `kbToMb(kb number) → number`

std/timeconv

import "std/timeconv" · use timeconv

- `secToMin(s number) → number`
- `minToHour(m number) → number`

std/msconv

import "std/msconv" · use msconv

- `msToSec(ms number) → number`
- `secToMs(s number) → number`

std/angle

import "std/angle" · use angle

- `normalizeAngle(d number) → number`
- `angleDiff(a number, b number) → number`

std/hex

import "std/hex" · use hex

- `toHex(n number) → text`
- `fromHex(s text) → number`

std/binary

import "std/binary" · use binary

- `toBinary(n number) → text`
- `fromBinary(s text) → number`

std/octal

import "std/octal" · use octal

- `toOctal(n number) → text`
- `fromOctal(s text) → number`

std/rot13

import "std/rot13" · use rot13

- `rot13(s text) → text`
- `rot47(s text) → text`

std/hash

import "std/hash" · use hash

- `hashText(s text) → number`
- `hashNumber(n number) → number`

std/checksum

import "std/checksum" · use checksum

- `xorChecksum(s text) → number`
- `sumBytes(s text) → number`

std/slug

import "std/slug" · use slug

- `slugify(s text) → text`
- `deslugify(s text) → text`

std/email

import "std/email" · use email

- `isEmail(s text) → bool`
- `domainOf(s text) → text`

std/phone

import "std/phone" · use phone

- `isPhone(s text) → bool`
- `digitsOnly(s text) → text`

std/ipv4

import "std/ipv4" · use ipv4

- `isIpv4(s text) → bool`
- `countDots(s text) → number`

std/html

import "std/html" · use html

- `escapeHtml(s text) → text`
- `unescapeHtml(s text) → text`

std/point

import "std/point" · use point

- `distance2d(x1 number, y1 number, x2 number, y2 number) → number`
- `midpointX(x1 number, x2 number) → number`

std/rect

import "std/rect" · use rect

- `area(w number, h number) → number`
- `perimeter(w number, h number) → number`

std/circle

import "std/circle" · use circle

- `area(r number) → number`
- `circumference(r number) → number`

std/triangle

import "std/triangle" · use triangle

- `areaBaseHeight(b number, h number) → number`
- `heron(a number, b number, c number) → number`

std/vector2

import "std/vector2" · use vector2

- `dot2(x1 number, y1 number, x2 number, y2 number) → number`
- `length2(x number, y number) → number`

std/collision

import "std/collision" · use collision

- `pointInRect(px number, py number, rx number, ry number, rw number, rh number) → bool`
