

AFRILANG Stdlib

std/c/finddividend

Français. Bibliothèque AFRILANG 'std/c/finddividend' (niveau complex, catégorie complex). Elle expose 7 fonction(s) : diviSum, diviMean, diviMin, diviMax, diviVar, diviStd, diviNorm.

```
'import "std/c/finddividend"' · 'use finddividend'
```

```
- 'diviSum(v list number) → number' - 'diviMean(v list number) → number' - 'diviMin(v list number) → number' - 'diviMax(v list number) → number' - 'diviVar(v list number) → number' - 'diviStd(v list number) → number' - 'diviNorm(v list number) → list number'
```

English. AFRILANG library 'std/c/finddividend' (tier complex, category complex). Exports 7 function(s): diviSum, diviMean, diviMin, diviMax, diviVar, diviStd, diviNorm.

```
'import "std/c/finddividend"' · 'use finddividend'
```

```
- 'diviSum(v list number) → number' - 'diviMean(v list number) → number' - 'diviMin(v list number) → number' - 'diviMax(v list number) → number' - 'diviVar(v list number) → number' - 'diviStd(v list number) → number' - 'diviNorm(v list number) → list number'
```

Contents

Français

1. Vue d'ensemble

Bibliothèque AFRILANG 'std/c/finddividend' (niveau complex, catégorie complex). Elle expose 7 fonction(s) : diviSum, diviMean, diviMin, diviMax, diviVar, diviStd, diviNorm.

'import "std/c/finddividend"' · 'use finddividend'

```
- `diviSum(v list number) → number`
- `diviMean(v list number) → number`
- `diviMin(v list number) → number`
- `diviMax(v list number) → number`
- `diviVar(v list number) → number`
- `diviStd(v list number) → number`
- `diviNorm(v list number) → list number`
```

2. Installation & import

Ajoutez le module à votre programme :

```
import "std/c/finddividend"
use finddividend
```

Niveau : complex · Catégorie : Modules complex (c/)
Domaines avancés – graphes, NLP, réseaux complexes.

3. Référence API

- diviSum(v list number) → number•
diviMean(v list number) → number•
diviMin(v list number) → number•
diviMax(v list number) → number•
diviVar(v list number) → number•
diviStd(v list number) → number•
diviNorm(v list number) → list

4. Exemples d'utilisation

```
import "std/c/finddividend"
use finddividend
```

```
create result = diviSum(/* args */)
say result
```

```
create result = diviMean(/* args */)
say result
```

```
create result = diviMin(/* args */)
say result
```

```
create result = diviMax(/* args */)
say result
```

```
create result = diviVar(/* args */)
say result
```

```
create result = diviStd(/* args */)
say result
```

5. Bonnes pratiques

- Préférez ``import "std/c/findividend"`` en tête de fichier.
- Lancez ``afriLang check`` avant de livrer.
- Combinez avec les modules stdlib de la même catégorie.
- Voir `/stdlib/` pour le source live et les démos playground.
- Signalez les problèmes sur GitHub si une export manque.

6. Annexe — source

module findividend

```
function diviSum(v list number) returns number
end
```

```
function diviMean(v list number) returns number
end
```

```
function diviMin(v list number) returns number
end
```

```
function diviMax(v list number) returns number
end
```

```
function diviVar(v list number) returns number
end
```

```
function diviStd(v list number) returns number
end
```

```
function diviNorm(v list number) returns list number
end
end
```

English

1. Overview

AFRILANG library 'std/c/finddividend' (tier complex, category complex). Exports 7 function(s): diviSum, diviMean, diviMin, diviMax, diviVar, diviStd, diviNorm.

'import "std/c/finddividend"' · 'use finddividend'

```
- `diviSum(v list number) → number`
- `diviMean(v list number) → number`
- `diviMin(v list number) → number`
- `diviMax(v list number) → number`
- `diviVar(v list number) → number`
- `diviStd(v list number) → number`
- `diviNorm(v list number) → list number`
```

2. Installation & import

Add the module to your program:

```
import "std/c/finddividend"
use finddividend
```

Tier: complex · Category: Complex modules (c/)
Advanced domains – graphs, NLP, complex networks.

3. API reference

- diviSum(v list number) → number•
diviMean(v list number) → number•
diviMin(v list number) → number•
diviMax(v list number) → number•
diviVar(v list number) → number•
diviStd(v list number) → number•
diviNorm(v list number) → list

4. Usage examples

```
import "std/c/finddividend"
use finddividend
```

```
create result = diviSum(/* args */)
say result
```

```
create result = diviMean(/* args */)
say result
```

```
create result = diviMin(/* args */)
say result
```

```
create result = diviMax(/* args */)
say result
```

```
create result = diviVar(/* args */)
say result
```

```
create result = diviStd(/* args */)
say result
```

5. Best practices

- Prefer ``import "std/c/finddividend"`` at the top of your file.
- Run ``afrilang check`` before shipping.
- Combine with related stdlib modules from the same category.
- See `/stdlib/` for the live source and playground demos.
- Report issues on GitHub if an export is missing or undocumented.

6. Appendix — source

module finddividend

```
function diviSum(v list number) returns number
end
```

```
function diviMean(v list number) returns number
end
```

```
function diviMin(v list number) returns number
end
```

```
function diviMax(v list number) returns number
end
```

```
function diviVar(v list number) returns number
end
```

```
function diviStd(v list number) returns number
end
```

```
function diviNorm(v list number) returns list number
end
end
```

Référence rapide / Quick reference

- Import : `import "std/c/finddividend"`
- Vérification : `afrilang check`
- Documentation : <https://afrilang.dev/stdlib/std/c/finddividend/>
