

AFRILANG Stdlib

std/c/geomcircle

Français. Bibliothèque AFRILANG 'std/c/geomcircle' (niveau complex, catégorie complex). Elle expose 6 fonction(s) : euclidean2d, area, circumference, contains, pointAt, intersectArea.

```
'import "std/c/geomcircle"' · 'use geomcircle'
```

```
- 'euclidean2d(x1 number, y1 number, x2 number, y2 number) → number' - 'area(r number) → number' - 'circumference(r number) → number' - 'contains(cx number, cy number, r number, px number, py number) → bool' - 'pointAt(cx number, cy number, r number, angle number) → list number' - 'intersectArea(r1 number, r2 number, d number) → number'
```

English. AFRILANG library 'std/c/geomcircle' (tier complex, category complex). Exports 6 function(s): euclidean2d, area, circumference, contains, pointAt, intersectArea.

```
'import "std/c/geomcircle"' · 'use geomcircle'
```

```
- 'euclidean2d(x1 number, y1 number, x2 number, y2 number) → number' - 'area(r number) → number' - 'circumference(r number) → number' - 'contains(cx number, cy number, r number, px number, py number) → bool' - 'pointAt(cx number, cy number, r number, angle number) → list number' - 'intersectArea(r1 number, r2 number, d number) → number'
```

1. Vue d'ensemble

Bibliothèque AFRILANG 'std/c/geomcircle' (niveau complex, catégorie complex). Elle expose 6 fonction(s) : euclidean2d, area, circumference, contains, pointAt, intersectArea.

```
'import "std/c/geomcircle"' · 'use geomcircle'
```

```
- `euclidean2d(x1 number, y1 number, x2 number, y2 number) → number`
- `area(r number) → number`
- `circumference(r number) → number`
- `contains(cx number, cy number, r number, px number, py number) → bool`
- `pointAt(cx number, cy number, r number, angle number) → list`
- `intersectArea(r1 number, r2 number, d number) → number`
```

2. Installation & import

Ajoutez le module à votre programme :

```
import "std/c/geomcircle"
use geomcircle
```

Niveau : complex · Catégorie : Modules complex (c/)
Domaines avancés – graphes, NLP, réseaux complexes.

3. Référence API

- euclidean2d(x1 number, y1 number, x2 number, y2 number) → number
- area(r number) → number
- circumference(r number) → number
- contains(cx number, cy number, r number, px number, py number) → bool
- pointAt(cx number, cy number, r number, angle number) → list
- intersectArea(r1 number, r2 number, d number) → number

4. Exemples d'utilisation

```
import "std/c/geomcircle"
use geomcircle
```

```
create result = euclidean2d(/* args */)
say result
```

```
create result = area(/* args */)
say result
```

```
create result = circumference(/* args */)
say result
```

```
create result = contains(/* args */)
say result
```

```
create result = pointAt(/* args */)
say result
```

```
create result = intersectArea(/* args */)
say result
```

5. Bonnes pratiques

- Préférez ``import "std/c/geomcircle"`` en tête de fichier.
- Lancez ``afri-lang check`` avant de livrer.
- Combinez avec les modules `stdlib` de la même catégorie.
- Voir `/stdlib/` pour le source live et les démos playground.
- Signalez les problèmes sur GitHub si une export manque.

6. Annexe — source

module `geomcircle`

```
function euclidean2d(x1 number, y1 number, x2 number, y2 number) returns number  
end
```

```
function area(r number) returns number  
end
```

```
function circumference(r number) returns number  
end
```

```
function contains(cx number, cy number, r number, px number, py number) returns bool  
end
```

```
function pointAt(cx number, cy number, r number, angle number) returns list number  
end
```

```
function intersectArea(r1 number, r2 number, d number) returns number  
end  
end
```

English

1. Overview

AFRILANG library 'std/c/geomcircle' (tier complex, category complex). Exports 6 function(s): euclidean2d, area, circumference, contains, pointAt, intersectArea.

'import "std/c/geomcircle"' · 'use geomcircle'

```
- `euclidean2d(x1 number, y1 number, x2 number, y2 number) → number`
- `area(r number) → number`
- `circumference(r number) → number`
- `contains(cx number, cy number, r number, px number, py number) → bool`
- `pointAt(cx number, cy number, r number, angle number) → list number`
- `intersectArea(r1 number, r2 number, d number) → number`
```

2. Installation & import

Add the module to your program:

```
import "std/c/geomcircle"
use geomcircle
```

Tier: complex · Category: Complex modules (c/)
Advanced domains – graphs, NLP, complex networks.

3. API reference

- euclidean2d(x1 number, y1 number, x2 number, y2 number) → number•
- area(r number) → number•
- circumference(r number) → number•
- contains(cx number, cy number, r number, px number, py number) → bool•
- pointAt(cx number, cy number, r number, angle number) → list•
- intersectArea(r1 number, r2 number, d number) → number

4. Usage examples

```
import "std/c/geomcircle"
use geomcircle
```

```
create result = euclidean2d(/* args */)
say result
```

```
create result = area(/* args */)
say result
```

```
create result = circumference(/* args */)
say result
```

```
create result = contains(/* args */)
say result
```

```
create result = pointAt(/* args */)
say result
```

```
create result = intersectArea(/* args */)
say result
```

5. Best practices

- Prefer ``import "std/c/geomcircle"`` at the top of your file.
- Run ``afriLang check`` before shipping.
- Combine with related stdlib modules from the same category.
- See `/stdlib/` for the live source and playground demos.
- Report issues on GitHub if an export is missing or undocumented.

6. Appendix — source

module geomcircle

```
function euclidean2d(x1 number, y1 number, x2 number, y2 number) returns number
end
```

```
function area(r number) returns number
end
```

```
function circumference(r number) returns number
end
```

```
function contains(cx number, cy number, r number, px number, py number) returns bool
end
```

```
function pointAt(cx number, cy number, r number, angle number) returns list number
end
```

```
function intersectArea(r1 number, r2 number, d number) returns number
end
end
```

Référence rapide / Quick reference

- Import : `import "std/c/geomcircle"`
- Vérification : `afriLang check`
- Documentation : <https://afriLang.dev/stdlib/std/c/geomcircle/>

Source (extrait)

```
module geomcircle

function euclidean2d(x1 number, y1 number, x2 number, y2 number) returns number
end

function area(r number) returns number
end

function circumference(r number) returns number
end

function contains(cx number, cy number, r number, px number, py number) returns bool
end

function pointAt(cx number, cy number, r number, angle number) returns list number
```

```
end
```

```
function intersectArea(r1 number, r2 number, d number) returns number
```

```
end
```

```
end
```
