

AFRILANG Stdlib

std/m/urlbuild

Français. Bibliothèque AFRILANG 'std/m/urlbuild' (niveau medium, catégorie medium). Elle expose 4 fonction(s) : buildUrl, buildWithQuery, encodeParam, joinParams.

'import "std/m/urlbuild"' · 'use urlbuild'

- 'buildUrl(scheme text, host text, path text) → text' - 'buildWithQuery(base text, query text) → text' - 'encodeParam(key text, value text) → text' - 'joinParams(params list text) → text'

English. AFRILANG library 'std/m/urlbuild' (tier medium, category medium). Exports 4 function(s): buildUrl, buildWithQuery, encodeParam, joinParams.

'import "std/m/urlbuild"' · 'use urlbuild'

- 'buildUrl(scheme text, host text, path text) → text' - 'buildWithQuery(base text, query text) → text' - 'encodeParam(key text, value text) → text' - 'joinParams(params list text) → text'

Français

1. Vue d'ensemble

Bibliothèque AFRILANG 'std/m/urlbuild' (niveau medium, catégorie medium). Elle expose 4 fonction(s) : buildUrl, buildWithQuery, encodeParam, joinParams.

'import "std/m/urlbuild"' · 'use urlbuild'

```
- `buildUrl(scheme text, host text, path text) → text`
- `buildWithQuery(base text, query text) → text`
- `encodeParam(key text, value text) → text`
- `joinParams(params list text) → text`
```

2. Installation & import

Ajoutez le module à votre programme :

```
import "std/m/urlbuild"
use urlbuild
```

Niveau : medium · Catégorie : Modules medium (m/)
Bibliothèques intermédiaires – import std/m.../

3. Référence API

- buildUrl(scheme text, host text, path text) → text•
- buildWithQuery(base text, query text) → text•
- encodeParam(key text, value text) → text•
- joinParams(params list text) → text

4. Exemples d'utilisation

```
import "std/m/urlbuild"
use urlbuild
```

```
create result = buildUrl(/* args */)
say result
```

```
create result = buildWithQuery(/* args */)
say result
```

```
create result = encodeParam(/* args */)
say result
```

```
create result = joinParams(/* args */)
say result
```

5. Bonnes pratiques

- Préférez 'import "std/m/urlbuild"' en tête de fichier.
- Lancez 'afirang check' avant de livrer.
- Combinez avec les modules stdlib de la même catégorie.
- Voir /stdlib/ pour le source live et les démos playground.
- Signalez les problèmes sur GitHub si une export manque.

6. Annexe — source

module urlbuild

```
function buildUrl(scheme text, host text, path text) returns text  
end
```

```
function buildWithQuery(base text, query text) returns text  
end
```

```
function encodeParam(key text, value text) returns text  
end
```

```
function joinParams(params list text) returns text  
end  
end
```

English

1. Overview

AFRILANG library 'std/m/urlbuild' (tier medium, category medium). Exports 4 function(s): buildUrl, buildWithQuery, encodeParam, joinParams.

'import "std/m/urlbuild"' · 'use urlbuild'

```
- `buildUrl(scheme text, host text, path text) → text`  
- `buildWithQuery(base text, query text) → text`  
- `encodeParam(key text, value text) → text`  
- `joinParams(params list text) → text`
```

2. Installation & import

Add the module to your program:

```
import "std/m/urlbuild"  
use urlbuild
```

Tier: medium · Category: Medium modules (m/)
Intermediate libraries – import std/m.../

3. API reference

- buildUrl(scheme text, host text, path text) → text•
buildWithQuery(base text, query text) → text•
encodeParam(key text, value text) → text•
joinParams(params list text) → text

4. Usage examples

```
import "std/m/urlbuild"  
use urlbuild
```

```
create result = buildUrl(/* args */)   
say result
```

```
create result = buildWithQuery(/* args */)   
say result
```

```
create result = encodeParam(/* args */)   
say result
```

```
create result = joinParams(/* args */)   
say result
```

5. Best practices

- Prefer `import "std/m/urlbuild"` at the top of your file. •
Run `afrilang check` before shipping. •
Combine with related stdlib modules from the same category. •
See /stdlib/ for the live source and playground demos. •
Report issues on GitHub if an export is missing or undocumented.

6. Appendix — source

module urlbuild

```
function buildUrl(scheme text, host text, path text) returns text
end
```

```
function buildWithQuery(base text, query text) returns text
end
```

```
function encodeParam(key text, value text) returns text
end
```

```
function joinParams(params list text) returns text
end
end
```

Référence rapide / Quick reference

- Import : `import "std/m/urlbuild"`
- Vérification : `afrilang check`
- Documentation : <https://afrilang.dev/stdlib/std/m/urlbuild/>

Source (extrait)

```
module urlbuild

function buildUrl(scheme text, host text, path text) returns text
end

function buildWithQuery(base text, query text) returns text
end

function encodeParam(key text, value text) returns text
end

function joinParams(params list text) returns text
end
end
```
